Tuning the SOC gap and M point higher order Van Hove singularities in the surface bands of Sr₂ RuO₄

Anirudh Chandrasekaran

Loughborough University 11 June 2024

Loading the Library

We first load the library by executing the following:

Outline of the strategy

We will begin by loading and interpolating the tight-binding models for various values of θ and then separately load and interpolate through the models with nematic term added. We will then interpolate linearly between the nematicity free model and the model with the nematic term to generate a continuously tunable model.

Interpolating between the Wannier90 files

Ingredients needed for symmetrization

```
ln[3]:= \rho = \{\{0, -1, 0\}, \{1, 0, 0\}, \{0, 0, 1\}\};
     (*The matrix part of the C_4 rotation about one of the Ru atoms.*)
     U\rho = \{\{0, -1, 0\}, \{1, 0, 0\}, \{0, 0, -1\}\};
     (*Representation of C<sub>4</sub> rotation in the d-orbital space.*)
     rxy = \{\{0, 1, 0\}, \{1, 0, 0\}, \{0, 0, 1\}\}; (*x \leftrightarrow y reflection.*)
     Urxy = \{\{-1, 0, 0\}, \{0, 1, 0\}, \{0, 0, -1\}\};
     (*Representation of the x \leftrightarrow y reflection.*)
     c\theta = \left\{\frac{1}{4}, \frac{3}{4}, \theta\right\}; (*Location of one of the Ru atoms,
     which we shall use as the centre of the C<sub>4</sub> rotation.*)
     AtomLocations =
       \big\{ \big\{ \frac{3}{4}, \frac{1}{4}, 0 \big\}, \big\{ \frac{3}{4}, \frac{1}{4}, 0 \big\}, \big\{ \frac{3}{4}, \frac{1}{4}, 0 \big\}, \big\{ \frac{1}{4}, \frac{3}{4}, 0 \big\}, \big\{ \frac{1}{4}, \frac{3}{4}, 0 \big\}, \big\{ \frac{1}{4}, \frac{3}{4}, 0 \big\} \big\} \big\};
     (*Location of the basis atoms in the fractional
      coordinates within the unit cell.*)
     SymmetryList = {}; (*This is a multidimensional list which we shall
      construct below. Each element is a sublist corresponding to a particular
      symmetry. First element of the sublist is real space symmetry's matrix part,
     second element is the translation part and the third element is
      its representation in the Hilbert space. Our point group is D4,
     or D<sub>8</sub> in some pepole's notation.*)
     Do[
        AppendTo[SymmetryList,
         {MatrixPower[\rho, i], (c0 - MatrixPower[\rho, i].c0) // Simplify,
          ArrayFlatten[IdentityMatrix[2]\otimesMatrixPower[U\rho, i]]}];
        AppendTo[SymmetryList,
         {MatrixPower[\rho, i].rxy, (c0 - MatrixPower[\rho, i].c0) // Simplify,
          ArrayFlatten[IdentityMatrix[2]⊗MatrixPower[Uρ, i]].
            ArrayFlatten[{{0, 1}, {1, 0}}⊗Urxy]}];
        , {i, 1, 4}];
```

Interpolation with symmetrization

We now interpolate between the Wannier90 data for 13 different rotations of the RuO octahedra: 0° through 12° to generate a continuously θ dependent Hamiltonian, whilst ensuring that the interpolated model has the right symmetry (for which we are feeding the list SymmetryList):

```
In[t1]:= FileLocn = NotebookDirectory[] <> "unrenormalized2/";
    W90Data = LoadInterpolateTBMs[{FileLocn <> "Sr2RuO4_0deg.dat",
         FileLocn <> "Sr2Ru04_1deg.dat", FileLocn <> "Sr2Ru04_2deg.dat",
         FileLocn <> "Sr2RuO4 3deg.dat", FileLocn <> "Sr2RuO4 4deg.dat",
         FileLocn <> "Sr2Ru04_5deg.dat", FileLocn <> "Sr2Ru04_6deg.dat",
         FileLocn <> "Sr2Ru04_7deg.dat", FileLocn <> "Sr2Ru04_8deg.dat",
         FileLocn <> "Sr2Ru04_9deg.dat", FileLocn <> "Sr2Ru04_10deg.dat",
         FileLocn <> "Sr2Ru04_11deg.dat", FileLocn <> "Sr2Ru04_12deg.dat"},
        \{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12\}, "Symmetries" \rightarrow SymmetryList,
        "OrbitalCentres" \rightarrow AtomLocations, "ParameterSymbol" \rightarrow "\theta"];
    Hamltn1[k1_, k2_, \theta_] = W90Data[1];
    Invalid or no lattice vectors provided! Using unit vectors.
    Tight-binding data files loaded.
    Space dimension: 3
    Number of orbitals: 6
    Number of supercells: 49
    Number of models/data-files to interpolate: 13
    Number of lines in the data files:
     Interpolating between the Hamiltonians.
    Valid symmetrization scheme provided! We will symmetrize the loaded Hamiltonian.
    Number of supercells after symmetrization: 79
```

Phenomenological spin orbit term

We now construct the phenomenological SOC terms:

```
In[14]:= Lx = {{0, 0, i}, {0, 0, 0}, {-i, 0, 0}};

Ly = {{0, 0, 0}, {0, 0, i}, {0, -i, 0}};

Lz = {{0, -i, 0}, {i, 0, 0}, {0, 0, 0}};

Hupup = \frac{1}{2} Lz;

Hupdown = \frac{1}{2} (Lx + i Ly);

Hdowndown = -\frac{1}{2} (Lx - i Ly);

Hdowndown = -\frac{1}{2} Lz;

Zero2 = ConstantArray[0, {3, 3}];

HSOC = Join[Join[Hupup, Zero2, Hupdown, Zero2, 2],

Join[Zero2, Hupup, Zero2, Hupdown, 2], Join[Hdownup, Zero2,

Hdowndown, Zero2, 2], Join[Zero2, Hdownup, Zero2, Hdowndown, 2]];
```

Reconstructing the full interpolated Hamiltonian

The full Hamiltonian incorporating SOC with tunable SOC strength and tunable θ . A version for the $\sqrt{2} \times \sqrt{2}$ unit cell that is tailor made for fitting to the ARPES data is also defined (since the bulk has one Ru atom per unit cell, its Brillouin zone has twice the area of the default surface band BZ, which is also 'rotated' by 45°).

```
In[23]:= Hamiltonian1[k1_, k2_, \theta_, \lambda_] = 
0.5 (ArrayFlatten[IdentityMatrix[2]\otimesHamltn1[k1, k2, \theta]] + 
\lambda HSOC + ComplexExpand[ConjugateTranspose[
ArrayFlatten[IdentityMatrix[2]\otimesHamltn1[k1, k2, \theta]] + \lambda HSOC]]);
```

We can check the eigenvalues at a high symmetry point to see if the symmetrisation was successful, and has eliminated the weak splitting of degeneracies at the high symmetry points

Loading and interpolating the nematic models

```
In[27]:= FileLocn2 = NotebookDirectory[] <> "renormalized/";
          W90Data2 = LoadInterpolateTBMs[
                  {FileLocn2 <> "Sr2Ru04_EXP_Monolayer_1theta_0phi1_0phi2_hr_sym_soc_nem.dat",
                    FileLocn2 <> "Sr2Ru04_EXP_Monolayer_1theta_0phi1_0phi2_hr_sym_soc_nem.dat",
                    FileLocn2 <> "Sr2RuO4 EXP Monolayer 2theta Ophi1 Ophi2 hr sym soc nem.dat",
                    FileLocn2 <> "Sr2Ru04_EXP_Monolayer_3theta_0phi1_0phi2_hr_sym_soc_nem.dat",
                    FileLocn2 <> "Sr2Ru04_EXP_Monolayer_4theta_0phi1_0phi2_hr_sym_soc_nem.dat",
                    FileLocn2 <> "Sr2Ru04_EXP_Monolayer_5theta_0phi1_0phi2_hr_sym_soc_nem.dat",
                    FileLocn2 <> "Sr2Ru04_EXP_Monolayer_6theta_0phi1_0phi2_hr_sym_soc_nem.dat",
                    FileLocn2 <> "Sr2Ru04_EXP_Monolayer_7theta_0phi1_0phi2_hr_sym_soc_nem.dat",
                    FileLocn2 <> "Sr2Ru04_EXP_Monolayer_8theta_0phi1_0phi2_hr_sym_soc_nem.dat",
                    FileLocn2 <> "Sr2Ru04_EXP_Monolayer_9theta_0phi1_0phi2_hr_sym_soc_nem.dat",

                    FileLocn2 <>
                       "Sr2RuO4_EXP_Monolayer_12theta_0phi1_0phi2_hr_sym_soc_nem.dat"},
                  \{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12\}, "ParameterSymbol" \rightarrow "\theta"];
          Hamiltonian2[k1_, k2_, \theta_] = W90Data2[1];
          Invalid or no lattice vectors provided! Using unit vectors.
          Tight-binding data files loaded.
          Space dimension: 3
          Number of orbitals: 12
          Number of supercells: 49
          Number of models/data-files to interpolate: 13
          Number of lines in the data files:
             \{1723, 1723, 1723, 1723, 1707, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 1723, 172
          Interpolating between the Hamiltonians.
          No valid symmetrization scheme
```

Comparing the nematic and symmetric models

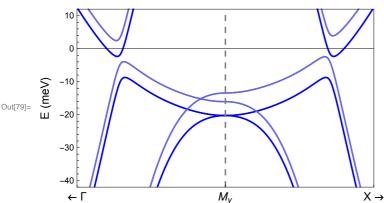

provided! We will not symmetrize the loaded Hamiltonian.

For the sake of plotting, let us define the Hamiltonians evaluated at $\theta = 8$ ° with and without the nematic term

```
HamTempNem[k_] := 1000 Hamiltonian2[k[1] - k[2], k[1] + k[2], 8]
  Using these the bands can be generated
```

```
In[74]:= HSymmPts =
        \{\{\{0, \pi-3.869 \times 0.36\}, "\in \Gamma"\}, \{\{0, \pi\}, "M_y"\}, \{\{3.869 \times 0.36, \pi\}, "X \rightarrow "\}\};
     Bnd1 = GenerateBandStructure[HamTemp, HSymmPts];
     Bnd2 = GenerateBandStructure[HamTempNem, HSymmPts];
In[77]:= plt1 = PlotBandStructure | Bnd1, {-42, 12},
         "AspectRatio" \rightarrow \frac{3}{r}, "yLabel" \rightarrow \{(*Label*)"E (meV)", (*Font Size*)\}
            12, (*Font Color*)Black, (*Font Family*)"Arial"},
         "xLabel" → {12, Black, "Arial"}, "yTicks" → {9, Black, "Arial"},
         "LineThickness" \rightarrow 0.005, "LineColorScheme" \rightarrow {RGBColor[0, 0, 1]}];
     plt2 = PlotBandStructure Bnd2, {-42, 12},
         "AspectRatio" \rightarrow \frac{3}{5}, "yLabel" \rightarrow \{(*Label*)"E (meV)", (*Font Size*)\}
            12, (*Font Color*)Black, (*Font Family*)"Arial"},
         "xLabel" → {12, Black, "Arial"}, "yTicks" → {9, Black, "Arial"},
         "LineThickness" → 0.005, "LineColorScheme" → {RGBColor[0.4, 0.4, 0.9]}];
```

Show[plt1, plt2]

The degeneracy at the M_{ν} point has been lifted which is to be expected since the nematic term breaks the r_{xy} reflection symmetry that causes the degeneracy.

A continuously $\theta(^{\circ})$ and $\Delta_{nem}(^{\circ})$ tuned model

```
HamiltonianNemTunedmeV[k1_, k2_, \theta_, \Delta_] =
  (1 - \Delta) 1000 × 0.2444 Hamiltonian1[k1 - k2, k1 + k2, \theta, 0.175] +
   1000 \triangle Hamiltonian2[k1 - k2, k1 + k2, \theta];
HamltnTuned[k_] := HamiltonianNemTunedmeV[k[1]], k[2]], k[3]], k[4]]
HamTempNem2[k ] :=
 HamiltonianNemTunedmeV[k[1], k[2], 8, 2(*Nematicity set to 2%*)]
```

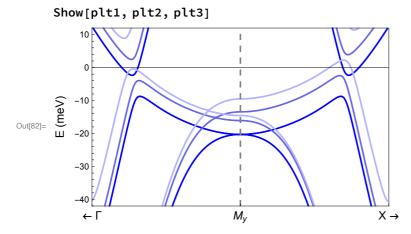

```
In[80]:= Bnd3 = GenerateBandStructure[HamTempNem2, HSymmPts];
In[81]:= plt3 = PlotBandStructure[Bnd3, {-42, 12},

"AspectRatio" → 3/5, "yLabel" → {(*Label*)"E (meV)", (*Font Size*)

12, (*Font Color*)Black, (*Font Family*)"Arial"},

"xLabel" → {12, Black, "Arial"}, "yTicks" → {9, Black, "Arial"},

"LineThickness" → 0.005, "LineColorScheme" → {RGBColor[0.7, 0.7, 1]}];
```

We can see that the interpolation scheme has worked.

Iterating through Δ_{nem} and hunting for HOS

Let us outline the strategy that we shall adopt below. We iterate through a few values of Δ_{nem} including 0%, 1% and 2%. At each Δ_{nem} , we will try to tune the M point singularity and the SOC gap critical points to a HOS. We note down the θ_{crit} and the series expansion of the four bands.

Now the bands(points) of interest are 5&6(M point), 7&8(M point), 7&8(SOC gap) and 9&10(SOC gap). For 5&6(M point) and 7&8(M point), tuning to HOS is simpler. We are already at a critical point, namely the high symmetry M point. We compute det(Hes) as a function of $\delta\theta$ and set it to zero to solve for $\delta\theta$. If we repeat this a few times we get θ_{crit} . But for the SOC gap critical points, we have to adopt a different strategy since the location of the critical point is not fixed and changes with θ and Δ_{nem} .

We will use a two-pronged strategy: first we choose a range of θ to investigate, say 8° to 10°. We locate the \mathbf{k}_{VHS} for the angles at the end points of the range and compute the Hessian determinant. If they are of opposite sign, we expect the Hessian determinant to vanish somewhere in between. We will then use binary search to locate this θ_{crit} . We have to do this separately for both the bands, and on either sides of the SOC gap (which have been made inequivalent by the nematic term).

Firstly, we have to identify the range of **k** in which the SOC critical points seem to exist by plotting

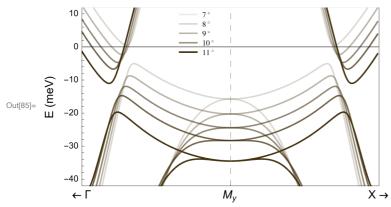

the dispersion for Δ_{nem} = 0%, 1%, 2% and 4% and θ = 7 °, 8 °, ..., 11 °. This is needed since we need to identify a suitable range for the LocateCriticalPoint routine to work to find the actual k_{VHS} .

Evolution of the band-structure

We plot a spagnetti plot showing the evolution of the band-structure with θ for different choices of Δ_{nem} (0%, 1% and 2%).

```
HSymmPtsNoLabel =

Evolution of the nature of the critical points in the SOC gap

In this section, we look at the evolution of the nature of the critical points as we change Δ_{nem} and θ , that is whether they are maxima, minima or saddles.

Upper VHS - Band 9, part 1

           \theta = 8, k_{crit} = \{1.25345, 3.14159\}, Tayl = 29.0708 + 404.815 k_x^2 - 21.4064 k_y^2
           \theta = 9, k_{crit} = \{1.28423, 3.14159\}, Tayl = 42.0426 + 404.599 k_x^2 - 12.7704 k_y^2
           \theta = 10, k_{crit} = \{1.31408, 3.14159\}, Tayl = 51.9031 + 413.994 k_x^2 - 5.23332 k_y^2
           \theta = 11, k_{crit} = \{1.34329, 3.14159\}, Tayl = 67.4569 + 432.759 k_x^2 + 1.15399 k_y^2
```

We see that all the HOS points indeed likely lie in the range [8°,11°] since the coefficient of k_{ν}^2 changes sign for all the values of Δ_{nem} in this range. Also, the critical point changes from an ordinary saddle to an ordinary minimum as we increase θ at each Δ_{nem} . Now for band 8 (downward dispersing):

Lower VHS - Band 8, part 1

```
In[118]:= Do
